

Epidemiology of neuro-genetic disorders in Northwestern Iran

Saeed Dastgiri, MPH, PhD, **Mortaza J. Bonyadi**, MSc, PhD,
Tuba Mizani, MD, MSc.

Neuro-genetic disorders are responsible for a major proportion of mortalities, morbidities, and handicaps across the world varying by racial, ethnic, and cultural differences. These disorders are common among developed and developing countries. Genetic disorders and congenital abnormalities occur in around 2-5% of live births accounting for approximately 30% of pediatric hospital admissions in many places in the region.^{1,2} The objective of this study was to estimate some epidemiological features of the neuro-genetic disorders in the northwest of Iran.

Received 14th October 2011. Accepted 13th February 2012.
